                                                                                                                                                                                                                                                                                                                                                                         ö
                                          The invention relates to functional variants and isolated mimetics of a MAGE-A1 human leukocyte antigen (HLA)-B35 or HLA-B44 binding peptide, or of a MAGE-A3 HLA-B35 binding peptide, identified by methods described in the specification. MAGE genes encode tumour rejection antigens (TRAs) presented to T lymphocytes by HLA-B35 and HLA-B44 molecules. The MAGE antigenic peptide acts by binding to HLA molecules on tumour cells and elimulating recognition of these cells and thus signalling them to the immune system for destruction. The peptide when presented by HLA molecule induces the activation and stimulation of CD8+ cytocoxic T lymphocytes. The MAGE antigenic peptide is used to treat and diagnose disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New synthetic polypeptides having several different segments of at least one parent polypeptide linked together differently compared to the linkage in the parent polypeptide, for inducing immune response against a pathogen or cancer.
                                                                                                                                                                                                        characterised by expression of MAGE-Al or -Al. Disorders include cancers e.g melanomas, oesophageal, lung, head and neck, breast, colorectal, prostate, renal, bladder, hepatocellular, papillary thyroid and gastric carcinomas, myelomas, brain tumours, sarcomas, seminomas, and ovarian tumours. The present sequence is human MAGE-Al protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a new synthetic polypeptide (I) comprising several different segments of at least one parent polypeptide linked together in a different relationship relative to their linkage in the parent polypeptide to impede, abrogate or otherwise alter at least one function associated with the parent polypeptide and for inducing an

immune response against a pathogen or cancer. Also included are a synthetic polypeptides encoding and a computer system for designing the synthetic polypeptides. The synthetic polypeptides and polynucleotides are referred to as a Savine. The synthetic polypeptide is useful for modulating immune responses preferably directed against a pathogen or a cancer, (e.g., cancers of the lung, breast, ovary, cervix, colon, head and neck, pancrass, prostate, stoomach, bladder, kidney, borne liver, cospopagus, brain, testicle, uterus), as potentiating agents. Compositions comprising the polypeptide may be used in the treatment or prophylaxis against virus), hepatitis, influenza, Japanese encephalitis virus, Epstein-Barr virus and respiratory syncytial virus), bacterial (e.g., infections caused by Neisseria, Meningococcal, Haemophilus, Salmonella, Streptococcal, Legionella and Mycobacterium or paragitic (e.g., infections caused by Plasmodium, Schistosoma, Leishmania, Trypanosoma, Toxoplasma and Gladdia) infections. The present sequence is a consensus sequence for a parent protein used to design a savine of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; epitope; vaccine; immunotherapeutic; cytostatic; immunogenicity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes an isolated epitope (I) and an epitope cluster. Also described is a vaccine or immunotherapeutic composition (VC) comprising (I). (I) has cytostatic activity. VC is useful for treating an animal, by administering to an animal, by administering to an animal the vaccine or immunotherapeutic composition. VC is also useful for evaluating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel epitopes useful as vaccines, comprises peptides or nucleic acid encoding the peptides, that are useful epitopes of target-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

polynucleotide sequence. Also disclosed is a method which is useful for determining presence of cytolytic T-cells specific for complexes of human leukocyte antigen (HLA) and a peptide detrived from the nucleic acid in a cytocoxic T-lymphocyte (CTL)-containing sample. The nucleic acid is useful as a diagnostic probe to determine the presence of abnormal
immunogenicity of a vaccine or immunotherapeutic composition, by administering VC to an HIA-transgenic animal and evaluating immunogenicity based on a characteristic of the animal, or by in vitro primary stimulation of a T cell and evaluating immunogenicity. (I) is useful for determining specific T cell frequency, by contacting T cells with a MHC-peptide complex, and further comprises ELISPOT analysis, limiting dilution analysis, flow cytometry, in situ hybridisation and/or polymerase chain reaction (PRR). ABQ83843 to ABQ83858 and ABP74128 to ABP74111 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TRAP; tumour rejection antigen precursor; cytolytic T-cell; CTL; tumour; seminoma; NSCLC; adaptor; head-and-neck squamous-cell carcinoma; breast carcinoma; sarcoma; cutaneous melanoma; nonsmall cell lung cancer; MAGE-A1; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel isolated nucleic acid encoding tumor rejection antigen precursor MAGE-C3, MAGE-B5, or MAGE-B6, useful as diagnostic probes to determine presence of abnormal e.g., tumor cells expressing MAGE-C1, MAGE-B5 or

Also disclosed is a vaccine or immunotherspeutic composition containing an epitope of the invention. Compositions of the invention may be used in the treatment of cancer. The method can be combined with a radiation therapy, chemotherapy, biochemotherapy or surgery. The composition is also useful for evaluating immunogenicity of a vaccine or immunotherspeutic compound. Multimeric MHC peptide complexes of the invention are useful for determining specific T cell frequency. This method is useful for evaluating immunological response, by performing the method prior to and subsequent to an immunisation step. Compositions of the invention are useful for invention at useful for current sequence represents an epitope of the invention with high affinity for MHC class I.
           head-and-neck squamous-cell carcinoma, breast carcinoma, sarcoma, cutaneous melanoma or nonsmall cell lung cancer (NSCLC) which express MAGE-C1, MAGE-B5 or MAGE-B6. The nucleic acid is useful for diagnosing a disorder characterised by expression of MAGE-C1, MAGE-B5 or MAGE-B6 TRAPs or tumour rejection antigens (TRAs). The present sequence represents the amino acid sequence of the human tumour rejection antigen MAGE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          class I

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a pharmaceutical composition containing at least one modified RNA encoding a biologically active or antigenic protein. The RNA is modified to optimise translation of the sequence. The compositions are used for vaccination against a wide range of infectious diseases (viral, bacterial or protozoal) or cancer, or for tissue regeneration, e.g. in cases of Alzheimer's or Parkinson's diseases and arthritis, but also to express proteins such as dystrophins, chloride ion channels (for treating cystic fibrosis) and enzymes (either for treating metabolic disorders or for synthesis of neurotransmitters such as
                                                                                                                                                                                                                                                                                                                                                                              Stabilised mRNA; translation optimised; vaccine; tissue repair; sequence modification determination; gene therapy; cytostatic; virucide; antibacterial; protozoacide; nootropic; neuroprotective; infection; antiparkinsonian; immunostimulant; cancer; MAGBI protein.

fragment of a kinase, phosphatase, protease, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, camporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide, or the antibody that binds to this polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for treating compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed promitived specification but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô

The present sequence represents a novel fusion protein composed of lipidated protein D (LPD) of Haemophilus influenzae B, the human MAGE-1 tumour-associated antigen and a hexahistidine tail. The invention relates to MAGE proteins fused to an immunological fusion partner such as LPD. The LPD moiety provides the fusion protein with additional exogenous T-call epitopes and also increase expression levels in E. coli. The lipid tail ensures optimal presentation of the antigen to antigen-presenting cells. The affinity tag facilitates purification. The novel fusion proteins provide vaccines for immunocherapy of melanomas or other MAGE-associated tumours like breast, bladder, lung and non-small cell lung cancer, head and squamous cell carcinoma, colon carcinoma and oesophagus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New protein derivatives used in cancer vaccine therapy for treating a range of cancers including melanomas, carcinomas and cancers of breast.
                        head and squamous cell carcinoma; colon cancer; oesophagus carcinoma; vaccine; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antigen presenting cell; vaccination; nootropic; neuroprotective; antiatrentosclerotic; cytostatic; antidiabetic; heptotropic; antiation antianisheric; tengoics; antibacterial; virucide; vaccine; Alzheimer's disease; atherosclerosis; cancer; diabetes;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    100.0%; Score 80; DB 2; Length 446; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a fusion protein composed of the C-terminal portion of the Streptococcus pneumoniae LYTA protein (CLYTA), the human MAGE-1 tumour-sesociated antigen and a hexahistidine tail. A vector designed for recombinant expression of the fusion protein in soluble fusion protein. Acciliates affinity purification, and also acts as a T-helper epitope. The invention relates to MAGE proteins fused to an immunological fusion partner, e.g. CLYTA-MAGE-1-His. These novel fusion proteins provide vaccines for immunocherapy of melanomas or other MAGE-associated tumours like breast, bladder, lung and non-small cell lung cancer, head and squamous cell carcinoma, colon carcinoma and oesophagus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MAGE-1; lipoprotein D; LPD-MAGE-1-His; fusion protein; tumour; melanoma;

The present invention describes a conjugate (I) for targeting antigen conjugated to a targeting moiety that is capable of binding to a cell conjugated to a targeting moiety that is capable of binding to a cell surface structure of an APC, and upon binding, inducing a cytotoxic T (I ymphocyte (CTL) and T-halper response. Also described: (I) a nucleic conjugated to expression sequence, operably linked of expression sequences for the APC; (3) a host cell transformed or transfected using the nucleic acid or expression vector; (4) a method for producing (I); (5) a method for generating an APC, capable of eliciting an immune response via MHC classes I and II presentation of processed antigen fragments; and (6) a pharmaceutical composition comprising (I) or the APC. (I) has nootropic, neuroprotective, virucide, antianteriosclerotic, cytostatic, antidabetic, hepatotropic, fungicide, antianteriosclerotic, Alzheimer's disease, atherosclerosis, and can be used in vaccines. The conjugate (I) or APC can be used for preventing, cancer, diabetes, hepatitis or paramitic, fungal, bacterial or viral infections. The present sequence represents a MatDC16-C-gamma-4-MAGE-AI infections. The present sequence represents a MatDC16-C-gamma-4-MAGE-AI invaniants.
                                                                                                                                                                                                                                                                                                                                                           New conjugate for targeting antigen presenting cells, useful for preventing, retardating or treating e.g., Alzheimer's disease, atherosclerosis, cancer, diabetes, hepatitis or fungal, bacterial or

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                         7, 2004, 15:18:26; Search time 17.4545 Seconds (without alignments) 47.324 Million cell updates/sec

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                               October 7, 2004, 15:30:52 ; Search time 59.6364 Seconds (without alignments) 86.336 Million cell updates/sec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 33,

Int. J. Cancer 59:435-439(1994).
Int. J. Subcrition Not known, though may play a role in embryonal development and tumor transformation or aspects of tumor progression. Antigen recognized on a melanoma by autologous cytolytic T lymphocytes.
INTSUE SPECIFICITY: Expressed in many tumors of several types, such as melanoma, head and neck squamous cell carcinoma, lung carcinoma and breast carcinoma, but not in normal tissues except
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Mol. Gen. Genet. 244:90-96(1994).

-!- FUNCTION: Fatty acid synthase gene.";

non-chain fatty acid synthase catalyzes the formation of the alpha subunit contains domains for: acyl carrier protein. The alpha subunit contains domains for: acyl carrier protein] reductase, and 3-oxoacyl-[acyl-carrier protein] reductase, and 3-oxoacyl-[acyl-carrier-protein] synthase. This subunit coordinates the binding of the six beta subunits to the enzyme complex.

-!- CATALYTIC ACTIVITY: Acetyl-CoA + N Malonyl-CoA + 2N NADPH = a long-chain acyl-CoA + N COA + N N NADPH.

-!- CATALYTIC ACTIVITY: Acetyl-carrier protein] + malonyl-[acyl-carrier protein] = 3-oxoacyl-[acyl-carrier protein] + co(2) + carrier protein] = 3-oxoacyl-[acyl-carrier protein] + malonyl-(acyl-carrier protein] + nalonyl-carrier protein] + NADPH.

-!- CATALYTIC ACTIVITY: (3R)-3-hydroxyacyl-[acyl-carrier protein] + NADPH.

-!- SUBUNIT: [Alpha (6) beta (6)] hexamers of two multifunctional subunits (alpha and beta).

-!- SIMILARITY: TO THE FATTY ACID SYNTHETASE, SUBUNIT ALPHA FROM OTHER FUNGI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             STRAIN=S288c;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Kim K., Kim K.-H., Storey M.K., Voelker D.R., Carman G.M.;
"Isolation and characterization of the Saccharomyces cerevisiae EKII gene encoding ethanolamine kinase.";
J. Blod. Chem. 274:14857-14866(1999)
-1- FUNCTION: Catalyzes the committed step of phosphatidylethanolamine synthesis via the CDP-ethanolamine pathway. Also exhibits choline kinase activity but its preferred substrate is ethanolamine.
-1- CATALYTIC ACTIVITY: ATP + ethanolamine = ADP + O-phosphoethanolamine.
-1- PATHWAY: Phosphatidylethanolamine biosynthesis.
-1- SIMILARITY: Belongs to the choline/ethanolamine kinase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

--- SUBUNT: Generally pentameric. This subunit coassembles with alpha-2, beta-1 and gamma-1.
--- SUBCELLULAR LOCATION: Integral membrane protein.
--- SIMILARITY: Belongs to the ligand-gated ionic channel family.

The present sequence is derived from a human MAGE-A1 HLA (human leukocyte antigen) class II-binding protein. Peptides derived from the MAGE-A1 HLA binding protein stimulate the activity and proliferation of CD4+ T lymphocytes. The MAGE-A1 HLA binding protein is useful as a diagnostic agent for diagnosing a disorder characterized by expression of MAGE-A1. The protein is used for treating a disorder characterized by expression of MAGE-A1 such as cancers e.g. melanomal, squamous cell carcinomas, colorectal carcinomas, osteosarcomas, and lymphocytic leukemias. Peptides derived from the MAGE-A1 HLA binding protein are useful in the production of anti-tumour vaccines Novel MAGE-A1 human leukocyte antigen class II peptides which bind to and are presented to the class II molecules, useful for inducing immune response and treating cancers characterized by expression of MAGE-A1. Van Der Bruggen P; MAGE-A1, HLA, human leukocyte antigen; CD4+ T lymphocyte; cancer; MAGE-A1 HLA class II-binding protein; vaccine. Peptide derived from human MAGE-Al HLA class II-binding protein.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is derived from a human MAGE-A1 HLA (human leukocyte antigen) class II-binding protein. Peptides derived from the MAGE-A1 HLA binding protein atimulate the activity and proliferation of CD4+T
lymphocytes. The MAGE-A1 HLA binding protein is useful as a diagnostic agent for diagnosing a disorder characterized by expression of MAGE-A1. The protein is used for treating a disorder characterized by expression of MAGE-A1 such as cancers e.g. melanomal, squamous cell carcinomas, of MAGE-A1 such as sosteedsarcomas, and lymphocytic leukemias. Peptides derived from the MAGE-A1 HLA binding protein are useful in the production
                                                                                                                                                                                                                                                                                                                                                                                                                 Novel MAGE-A1 human leukocyte antigen class II peptides which bind to and are presented to the class II molecules, useful for inducing immune response and treating cancers characterized by expression of MAGE-A1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present sequence is derived from a human MAGE-A1 HLA (human leukocyte antigan) class II-binding protein. Peptides derived from the MAGE-A1 HLA binding protein stimulate the activity and proliferation of CD4+ T lymphocytes. The MAGE-A1 HLA binding protein is useful as a diagnostic agent for diagnosing a disorder characterized by expression of MAGE-A1. The protein is used for treating a disorder characterized by expression of MAGE-A1 cotoin as cancers e.g. melanomal, squamous cell carcinomas, octooaxarcomas, and lymphocytic leukemias. Peptides derived from the MAGE-A1 HLA binding protein are useful in the production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel MAGE-A1 human leukocyte antigen class II peptides which bind to and are presented to the class II molecules, useful for inducing immune response and treating cancers characterized by expression of MAGE-A1.

AAQ85435 encodes AAR70909 human melanoma antigen MAGE-1, it was used to produce the C-terminal MAGE-1 peptides described in AAR70915 to AAR70969.
These peptides are useful for defining epitopes that engender a HLA-restricted cytotoxic lymphocyte activity against MAGE-1 antigens. Compans. containing these peptides can be administered, as a vaccine to patients susceptable to MAGE associated tumours, e.g. melanomas. (Updated on 25-MAR-2003 to correct PV field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This is the amino acid sequence of human tumour rejection antigen precursor (TRAP) MAGE-A1. MAGE-A1 cDNA (see AAV69719) shows homology to novel human MAGE-C1 cDNA (see AAV69720). MAGE-C1 (see AAW81546) is a novel member of the MAGE family that may be recognised by cytotoxic Tells, leading to lysis of the tumour cells which express it. It is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Tumour rejection antigen precursors – used for determining presence of cytolytic T cells specific for complexes of a human leukocyte antigen.
                                                                                                                                                                                                       Human melanoma antigen, MAGE-1, peptide(s) - useful for stimulating immune response against melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MAGE-Al; human; tumour rejection antigen precursor; TRAP; therapy;
